COLLEGE of COMPUTER STUDIES

Final Project and Final Exam
FUNDAMENTALS OF PROGRAMMING
CCCS – 102

Fundamentals of Programming

Project Overview:

This final project aims to reinforce the fundamental concepts covered in the "Fundamentals of Programming" course. The project will guide you through the basics of programming, algorithm design, problem-solving, and Python programming.

Project Tasks:

- Task 1: Algorithm Design and Python Basics
  - Design a simple algorithm for a specific problem.
  - Implement the algorithm in Python.
  - Use basic input/output for user interaction.

- Task 2: Operators and Control Structures
  - Create a program that involves the use of various operators.
  - Implement conditional statements and looping structures.

- Task 3: String Manipulation
  - Develop a program that manipulates strings using different operations.
  - Explore formatting and parsing techniques.

- Task 4: File Handling and Exception Handling
  - Read data from a file, perform operations, and write the results back to another file.
  - Implement exception handling to manage potential errors.

Project Submission:

Prepare a documentation that includes:

- Introduction to your project.
- Code snippets for each task.
- Explanations and comments for the code.
- Screenshots of program output for verification.
- Challenges faced and how they were overcome.
- Conclusion and key takeaways.

Final output: **pdfile(pdf), long size**

File Name: **GROUP_ CCCS_102_PROJECT.zip**

- **PROJECT.pdf**
- **Original source code (folder)**
